CREATION CARRIAGE CALIBRATION

Place the nickel under the 'C' shaped clip and hold it down as shown. I’d recommend using your middle finger for this step.

Loosen the alan screw while keeping a finger on the silver cylinder. This will allow the shaft of the carriage arm and the blade holder to drop to the cut-strip.
The blade holder should be touching the cut strip.

Now that the blade holder is touching the cut-strip, tighten the alan again.
After you're done, when you push down on the plunger (the electro-magnet), the blade-holder should hit the cut strip before the plunger "bottoms out". It should look just like this.
